

DAX MEASURES DOCUMENTATION

1. Total Exposure

DAX Formula

Total Exposure =
SUM('Auto Loan Data'[Current Balance])

Purpose

Calculates the total outstanding balance of all active loans in the securitised portfolio.

Business Significance

Represents the total amount exposed to credit risk and serves as the primary portfolio size indicator.

Dashboard Usage

Executive Dashboard, Investor Reporting Dashboard

2. Net Cashflow

DAX Formula

Net Cashflow =
SUM('Auto Loan Data'[Current Balance]) -
SUM('Auto Loan Data'[Expected Loss])

Purpose

Calculates the net expected cash inflow after accounting for expected losses.

Business Significance

Used for investor reporting and securitisation cash flow analysis.

Dashboard Usage

Executive Dashboard, Waterfall Dashboard

3. Average Probability of Default (PD)

DAX Formula

Avg PD =
AVERAGE('Auto Loan Data'[PD])

Purpose

Calculates the average probability that borrowers will default.

Business Significance

Key indicator used in credit risk assessment and IFRS 9 calculations.

Dashboard Usage

Executive Dashboard, IFRS 9 Dashboard

4. Average Loss Given Default (LGD)

DAX Formula

Avg LGD =
AVERAGE('Auto Loan Data'[LGD])

Purpose

Measures expected percentage loss after borrower default.

Business Significance

Helps estimate expected credit losses.

Dashboard Usage

Executive Dashboard, IFRS 9 Dashboard

5. Exposure at Default (EAD)

DAX Formula

Total EAD =
SUM('Auto Loan Data'[EAD])

Purpose

Calculates total outstanding exposure expected at default.

Business Significance

Important component of IFRS 9 Expected Credit Loss calculations.

Dashboard Usage

IFRS 9 Dashboard

6. Expected Credit Loss (ECL)

DAX Formula

```
Total ECL =  
SUMX(  
  'Auto Loan Data',  
  'Auto Loan Data'[PD] *  
  'Auto Loan Data'[LGD] *  
  'Auto Loan Data'[EAD]  
)
```

Purpose

Calculates expected losses based on probability of default, loss severity, and exposure.

Business Significance

Supports IFRS 9 impairment reporting and risk provisioning.

Dashboard Usage

IFRS 9 Dashboard, Executive Dashboard

7. Cure Rate

DAX Formula

```
Cure Rate =  
DIVIDE(  
  COUNTROWS(  
    FILTER(  
      'DPD History',  
      'DPD History'[Cure Flag] = "Yes"  
    )  
  ),  
  )
```

```
COUNTROWS('DPD History')  
)
```

Purpose

Measures the percentage of delinquent loans that return to current status.

Business Significance

Evaluates collection effectiveness.

Dashboard Usage

DPD Dashboard

8. Roll to Default Rate

DAX Formula

```
Roll to Default Rate =  
DIVIDE(  
COUNTROWS(  
FILTER(  
'DPD History',  
'DPD History'[DPD Bucket] = "Default"  
)  
)  
,  
COUNTROWS('DPD History')  
)
```

Purpose

Measures migration of loans into default.

Business Significance

Provides early warning of portfolio deterioration.

Dashboard Usage

DPD Dashboard

9. Pool Factor

DAX Formula

Pool Factor =
DIVIDE(
SUM('Vintage Data'[Current Balance]),
SUM('Vintage Data'[Original Balance])
)

Purpose

Measures remaining portfolio balance relative to original balance.

Business Significance

Tracks amortisation of the securitised pool.

Dashboard Usage

Vintage Dashboard, Investor Reporting Dashboard

10. Static Cumulative Net Loss (CNL)

DAX Formula

Static CNL =
SUM('Vintage Data'[Net Loss]) /
SUM('Vintage Data'[Original Balance])

Purpose

Calculates cumulative losses within a static pool.

Business Significance

Used to assess long-term performance of loan vintages.

Dashboard Usage

Vintage Dashboard

11. Conditional Default Rate (CDR)

DAX Formula

CDR =
AVERAGE('Dynamic Loss'[CDR])

Purpose

Measures annualised default rate.

Business Significance

Key securitisation performance metric.

Dashboard Usage

Dynamic Loss Dashboard

12. Conditional Prepayment Rate (CPR)

DAX Formula

CPR =
AVERAGE('Dynamic Loss'[CPR])

Purpose

Measures annualised prepayment behaviour.

Business Significance

Used for cashflow forecasting.

Dashboard Usage

Dynamic Loss Dashboard

13. Recovery Rate

DAX Formula

Recovery Rate =
DIVIDE(
SUM('Dynamic Loss'[Recoveries]),
SUM('Dynamic Loss'[Defaults])
)

Purpose

Measures percentage of losses recovered after default.

Business Significance

Indicates effectiveness of recovery processes.

Dashboard Usage

Dynamic Loss Dashboard

14. Excess Spread

DAX Formula

Excess Spread =
 $\text{SUM}(\text{'Dynamic Loss' [Interest Income]}) -$
 $\text{SUM}(\text{'Dynamic Loss' [Losses]})$

Purpose

Calculates residual earnings after covering portfolio losses.

Business Significance

Acts as a protective buffer for investors.

Dashboard Usage

Dynamic Loss Dashboard, Investor Reporting Dashboard

15. Base Expected Loss

DAX Formula

Base EL =
[Total ECL]

Purpose

Represents expected loss under normal economic conditions.

Dashboard Usage

Stress Testing Dashboard

16. Mild Stress Expected Loss

DAX Formula

Mild Stress EL =
[Total ECL] * 1.25

Purpose

Estimates losses under moderate stress conditions.

Dashboard Usage

17. Severe Stress Expected Loss

DAX Formula

Severe Stress EL =
[Total ECL] * 1.50

Purpose

Estimates losses under severe economic downturn scenarios.

Dashboard Usage

Stress Testing Dashboard
